NITRATE IN YOUR WELL WATER

Tips to Protect Your Well Water

IDAHO DEPARTMENT OF HEALTH & WELFARE
DIVISION OF PUBLIC HEALTH

Private wells can provide a clean, safe source of water if they are properly located, built, and maintained. As a private well owner, it is your responsibility to make sure that your water is safe to use by testing for contaminants. This brochure provides information on nitrate and helps you understand the possible health effects of drinking water with high levels of nitrate.

WHAT IS NITRATE?

Nitrate is a compound that can be found in private well water. High levels of nitrate in drinking water are often caused by groundwater contamination from animal waste run-off at dairies and feedlots, excessive use of fertilizers, or seepage of human sewage from private septic systems.

WHAT ARE THE HEALTH CONCERNS?

Nitrate can be converted to nitrite in the human body where it lessens the ability of blood to carry oxygen. This is of greatest concern for infants, pregnant, and nursing women. In infants less than 6 months old, nitrate levels above 10 milligrams per liter of water (mg/L) in drinking water can reduce the amount of oxygen in the child's blood and cause blue baby syndrome. This is a very dangerous condition with symptoms including shortness of breath and a bluish tint to the skin indicating the baby is not getting enough oxygen.

WHAT CAN I DO TO REMOVE NITRATE FROM MY WATER?

Certified treatment devices such as reverse osmosis, distillation, and ion exchange systems can be used to remove nitrate from water. To determine the best method of removing nitrate from your well, call the NSF International Consumer Hotline at 1-800-673-8010.

If your test level is above 10 mg/L, do not use the water to make baby formula and do not drink the water if you are pregnant or nursing. *Note: Boiling water will not remove nitrate.*

WHAT CAN I DO TO MAINTAIN MY WATER SYSTEM?

If you install a treatment device, follow the manufacturer's suggested maintenance schedule to be sure your water is safe. Also, your well should be maintained to keep it in good working order. To help keep track of well maintenance, it is recommended that you create and maintain a "system maintenance log." The log should include the location of the well, construction and contractor details, as well as results of any water tests. A copy of a log is available online at environmentalhealth.dhw.idaho.gov. For questions about your well water, contact your local public health district.

SUGGESTED TESTING SCHEDULE

Contaminants	How often should I test?
Arsenic Uranium Fluoride	Once every 3 to 5 years
Bacteria Nitrate	Once a Year

POSSIBLE HEALTH RISKS BY LEVEL OF NITRATE

Nitrate Level	Interpretation
0-10 mg/L	Safe for humans and livestock. However, concentrations of more than 5 mg/L are an indicator of possible pollution sources and could cause environmental problems.
11-20 mg/L	Not safe for infants, can cause blue baby syndrome. Generally safe for adults and livestock.
21-40 mg/L	Should not be used as a drinking water source except for short-term use for adults and livestock.
41-100 mg/L	Risky for adults and young livestock. Probably acceptable for mature livestock if feed is low in nitrate.
Over 100	Should not be used by humans and livestock.

Table adapted from Utah State University Extension
mg/L = milligrams per liter of water
